Wine Cork Shadow Box

Cutting vinyl with the Brother ScanNCut DX is easy! And the scanning feature makes it easy to go from a printed image to a design you can cut. Vinyl applied to a shadow box makes a great home décor piece to remember great occasions celebrated with wine.

Tools

[Brother ScanNCut DX](#)

Instructions

1. Clean the shadow box glass well. Be sure it's dry before you continue.
2. Place the printed image on the scanning mat and scan the design in to the Brother ScanNCut DX.
3. Set the cutting machine to do a "half cut" (also called a "kiss cut") so that it's only cutting the vinyl and not the clear carrier sheet. It's best to always do a test cut to ensure the settings are appropriate for the material you are using. Place a small piece of scrap vinyl, vinyl side up (carrier sheet side down) on the cutting mat, and do a test cut to verify you have the appropriate settings. Continue making test cuts and adjusting the settings until you're satisfied with the cuts you achieve.
4. Place the adhesive vinyl, carrier sheet down against the cutting mat, recall the scanned design, size it appropriately, and cut the design in to the vinyl.
5. Weed away the undesirable pieces of vinyl, leaving your finished design on the carrier sheet.
6. Use the application tape to transfer the design from the carrier sheet to the glass on the shadow box.
 - a. First apply the tape to the vinyl on the carrier sheet
 - b. Then peel away the application tape, so the vinyl is adhered to the tape, leaving the carrier sheet behind
 - c. Apply the tape to the glass and burnish it down well
 - d. Peel away the tape, leaving the vinyl adhered to the glass
